Sea turtles are reptiles. Sea turtles have flat, streamlined shells. The shells of sea turtles are very hard. Leather skin instead of a shell. Sea turtles can see, hear and smell. They do not have teeth, but have strong jaws.

1. Sea turtles are _____.
2. They have flat, streamlined _____.
3. Sea turtles can see, _____ and _____.
4. Do sea turtles have teeth? Yes _____ No _____.

Name _____ Read. **Singers at Sea** Humpback whales Comprehension

Did you know that some whales can sing? Some humpback whales make sounds that are like songs. They moan and grunt and squeak. A whale might sing for twenty minutes. Some whale songs can be heard miles away. Not all humpback whales sing. Only the male whales sing. They sing mostly in the winter. No one knows for sure why they sing. Some people think singing is their way to talk to other whales. Many people like to hear the songs. They think they are pretty!

Circle True or False.

1. Sometimes humpback whales squeak. True False
2. Female humpback whales sing all the time. True False
3. Some whale songs are longer than ten minutes. True False
4. All humpback whales sing a lot in the spring. True False
5. No one likes to listen to whale songs. True False

Write. Why do you think humpback whales sing? Explain. _____

©The Mailbox®

Name _____ PROVE it!

Answer each question in one color. Write your answer in the space provided. Draw your answer with the same color as your question.

1) What makes an animal a reptile?

2) How are freshwater and saltwater crocodiles different?

3) What do crocodiles do on the ground?

Name _____ Skill: Reading Comprehension
Read the story and answer the questions. Soccer

The most popular sport in the world is soccer. In most European and Latin American countries, it is the national sport. A game similar to soccer was probably played in China as early as 2,000 B.C. In England, soccer was first played in the 11th century. In the 12th century, many English school children played soccer. As the game developed, many rules were being made up. Some schools had different rules. Some towns had different rules. Some countries had their own rules and they also interpreted rules differently from other teams. The first official rules of soccer were written in 1863 by the Football Association. The game has been growing ever since. Today, By 1990, official soccer rules have been adopted by 140 countries. Brazil, Argentina, Italy, Spain, France, Germany, England, and the United States are just a few of the countries that play soccer. The first World Cup soccer championship was played in 1930 in Montevideo, Uruguay. The World Cup is held every four years. Soccer is the most popular sport in the world and probably continues to grow and grow as it has certainly about the last 100 years.

1. Who is the most popular sport in the world?
A. to trace the history of the game of soccer
B. to show how soccer is played
C. to convince the reader that soccer is the best sport ever

2. Around what year did children in London begin to play soccer?

3. Why were official soccer rules established in 1946?

4. Which countries had established official soccer associations by 1900?

5. Where and when was the first World Cup championship played?

Only 14% of the plastic packaging is recycled today, while our general use of plastic continues to increase. 8 million tons of plastic in the ocean annually in the year, add approximately 8 million tons of plastic to the ocean. Of course, other factors contribute to the destruction of this ecosystem, but millions of people take beach shells and take them home significantly add to the problem. Photo Cortesía: Pixabay Some scientists believe that the delicate balance in the ocean is preparing to collapse. However, human acetic contamination, created largely from the trillions of ships, creates a severe interruption between sea creatures and whales in particular. Around a billion birds die each year due to the plastic they ingest. The problem of the problem is that humans produce more than 300 million tons of plastic annually, and half of that production is a single use of a single use. In general, the world has seen a 38% decrease in seaweed forests in the last 50 years, and shows no signs of improvement. The days to marine environments, even if all consequences are immediately obvious. We may not look connected, but the health of the world's oceans plays a key role in the survival of humanity. The climatic change is only causing the sea level to increase and the white coral reefs that are in the heart of many marine ecosystems. Normally, that would be an extremely exciting occasion. More than 100,000 marine invertebrates are found annually due to the remains of plastic in the water. If the warming causes the Greenland ice layer to melt, the sea level could increase by another 20 feet around the world. Take a look at some of the destruction caused by the man who must change if the narg narg nu se eteE .ocits;Alp ed sadaleon ed sealeon .561 ed Aa etnehtoe ayneAa.ydne0592 arad seetey ed qtsM;AM;ohc ortha etnehtoe ayneAa. The ocean pollution is a different and expensive task. Many levels in the changes of recycling and reducing mercury levels in the sea to increase. If the sea level increases, a large part of the population in the world will be severely affected. Almost a third of all our carbon dioxide emissions end up in the ocean. Industrial wastewater that goes to the waste of the anos industrial ones, even when legally arranged, are often eliminated in the oceans as well as the rest of the wastewater that comes from national and commercial sources. Photo Cortesía: Kyle Taylor/Flickr The severe coral laundering solve to the reefs approximately every 27 years, but since the 80s, the average rate has increased every six years. That may not sound bad, but algae that bloom at such a high rate releases dangerous levels of toxins in the water, poisoning marine life and potentially destroying ecosystems and turning them into dead areas. To support any marine life. Turtles eat plastic because they confuse it with food. While much of the debris occurs within the first weeks of the spill, the indirect damage that takes longer to appear is also a problem. The great reef barrier, in particular, has been severely affected. Photo courtesy: Michaelisscientists/Wikimedia Commons The tons of plastic that make their way in the ocean each year, it probably should not be a surprise to find the plastic that reaches the depths of the ocean. Invasive species are another cause of damage. They are Yangtze, the Indo, the Yellow River, the Río Grande, the Ganges, the Río Pearl, the Río Amur, the Níger and the Mekong, in the order of pollution. The levels of acidity in the emissions of oceanic dioxide are causing the ocean to obtain much more than what it was before. The problem is that industrial wastewater tends to be much dangerous, which contains heavy metals such as lead, arsenic and mercury. They are found on the coast of each continent, except the antarctic. Many marine animals use them for shelter and food. He entered from the Río, who then carried the plastic to the sea. In addition, oil spills can cause delicate coastal wetland ecosystems to erosion over time. Worn fish populations, overfishing. Photo Cortesía: Pigsels Another problem is that much of the plastic that contaminates the ocean sinks to the bottom. The effects will completely alter the marine food chain, causing food shortage for marine animals and severely alter the amount of seafood that humans can harvest. The connection of air pollution with coastal toxicity is not just garbage and agriCola that pollutes the ocean. All these consequences can easily lead to death. The forests of marine forests that turn off are one of the diverse ecosystems of the ocean. Since the day of 1960, the dead areas have doubled each day. More of Simpli Photo Cortesía: Peakpx Marine Sound Contamination also affects many other sea creatures. Unfortunately, we use articles for minutes that end up staying on the planet for a few hundred years. Photo courtesy: Danilocarta/Pixabay scientists think that approximately 60% of the seabirds have eaten some kind of plastic to date. Moreover, not all chemicals are eliminated through the wastewater treatment process, and much of it ends in the ocean, contaminating water and threatening the marine ecosystem. Dificto clearing the ocean plastic The plastic problem contaminating our oceans at a rate of 8 million tons per year worsen by the fact that it is not easy to remove all that plastic once it is there. Photo courtesy: Alfred T. Photo courtesy: Jason Auch/Wikimedia Commons The rising sea temperature threatens, for example, and leads to more frequent and more intense storms. Prohibiting destructive fishing policies as soon as possible, particularly as a result of drastic climate change, is critical to ensuring that we are not left without fish. Gone Extinto, which was not so surprising, considering that cod fisheries fed millions of people and contributed massively to the economy. Photo courtesy: Hydrosami/Wikimedia Commons If the ice sheet in Greenland began to melt drastically, the likely impact on the Gulf current sohcum sohcum ne amilc le including North America and Europe. Photo Courtesy: NA/PxFuel This level of acidity will kill many marine creatures, such as corals, plankton and oysters. Many U.S. states have already passed laws restricting or banning the sale of microbeads, but glitter hasn't been included. This temperature rise is responsible for drastic changes in marine ecosystems, including deadly coral bleaching. Because farms use a lot of fertilizers and pesticides, those toxic substances end up in rivers and, eventually, the sea, causing damage to marine ecosystems. For instance, in Australia, Japan and the Mediterranean, tropical fish are chowing down on kelp that isn't a normal part of their diet. Whoa! The Ellen MacArthur Foundation predicts there will be more plastic in the oceans than fish by 2050, with the plastic speculated to weigh at least 937 million tons versus 895 million tons of fish. Half of the reef has died since 2016 because of warmer ocean waters killing the reef's main food source: colorful algae. Unfortunately, CO₂ and other types of air pollution are absorbed by the sea, dissolving into carbonic acid. Despite awareness about climate change and the disastrous impacts it could have on Earth and human life, air quality in the U.S. has actually gotten worse in the past few years. Sea temperatures are rising rapidly as they absorb most of the heat trapped on Earth due to greenhouse gas emissions. When humans consume mercury, it can lead to neurological disorders. Human Sound Pollution and Marine LifeSound pollution is often not considered when thinking about the ways humans are impacting marine ecosystems and life. Unless we can prevent the sea temperature from increasing even further, we face irreversible damage to the planet. Massive Coral Bleaching of the oceans coral reefs are bleaching at unprecedented rates, thanks to rising sea temperatures. This is because whales use sound to communicate and the sound energy is being absorbed by the water, causing the water to heat up. This heat is then transferred to the coral, causing it to expel its symbiotic algae (zooxanthellae), which provides the coral with energy and color. As the coral loses its color, it becomes "bleached". Massive coral bleaching events have occurred in the past, such as the 1997-1998 event, which affected over 90% of the coral reefs in the Indian Ocean. Another major event occurred in 2016, affecting coral reefs in the Pacific Ocean. These events have had a significant impact on the health of coral reefs, leading to their decline and loss of biodiversity. The loss of coral reefs has far-reaching consequences, including the loss of habitat for many marine species and the disruption of the marine ecosystem. It is important to take action to prevent further coral bleaching and protect coral reefs for future generations.
